

# The Squirrels of Central Park NYC

# Central Park

- Central Park is an urban park in New York City, 4km's long and 0.8km wide.
- At 843 acres, it is the fifth largest park in the city.
- And the most visited urban park in the United States.

# Purpose

To understand the type of squirrels in Central Park, where they are located, and behaviour they exhibit.

# Objectives

To understand...

Where the squirrels are located

Type of squirrels in terms of colour and age

Behaviour being exhibited at time of observation

## 5 key stages

Sourcing

# Sourcing Data

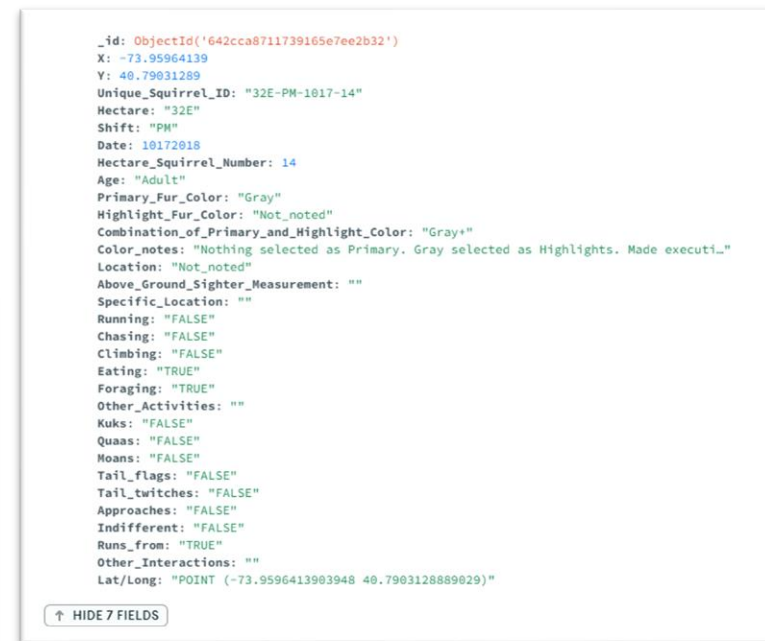

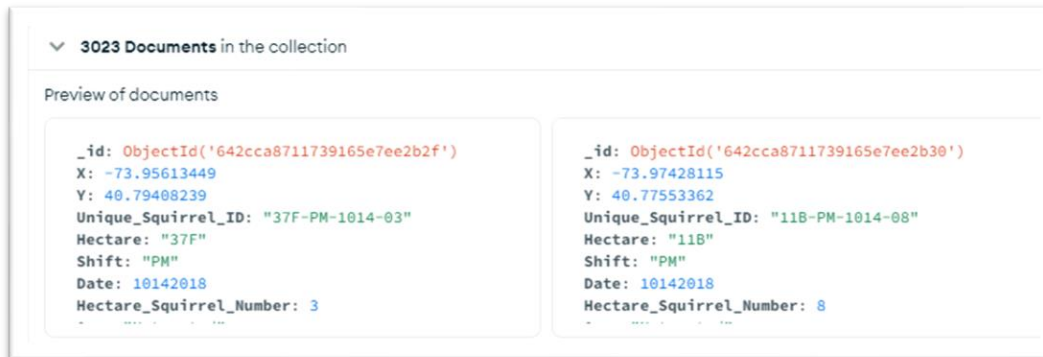

<b>Source</b>	NYC Open Data – 2018 Central Park Squirrel Census <a href="https://data.cityofnewyork.us/Environment/2018-Central-Park-Squirrel-Census-Squirrel-Data/vfnx-vebw">https://data.cityofnewyork.us/Environment/2018-Central-Park-Squirrel-Census-Squirrel-Data/vfnx-vebw</a>
<b>How</b>	323 volunteers, clubs and government agencies counted squirrels and collected observational data in Central Park New York
<b>When it was collected</b>	Data Collection occurred in October 2018.
<b>Size of dataset</b>	Dataset contains information on 3,023 squirrels
<b>Format</b>	CSV file downloaded from The City of New York website.

# Database set up & data cleaning

## The CSV file was imported into MongoDB

```
mongoimport --type csv -d squirrels_db -c squirrels --headerline --drop 2018_Central_Park_Squirrel_Census_-_Squirrel_Data.csv
```

# Database set up and data cleaning

## Number of documents

- Checked the number of documents was equal to 3,023 the total number in the csv file.

## Unique Squirrel ID

- Identification tag for each squirrel sighted.
- In reviewing the data, there were five Unique Squirrel ID's that appeared twice in the data set.
- For each of the duplicates the data was the same, except for longitude and latitude which was slightly different. The decision made to retain these duplicates in the dataset.

## Missing data

- The main aspect of data cleaning was fields missing data.
- Updated fields with no data with 'Not\_noted' to aid analysis later on.

## Reviewed all relevant fields

- To ensure the data contained was as expected and fit for purpose.

# Analysis

Focus at this stage was running the data to better understand it and start to formulate a story, specifically:

- The **types of squirrels** found in Central park, based on primary fur colour and age
- Where they are **located** and whether this differs by squirrel type.
- **Behaviour** they were undertaking when observed, in terms of eating, movement, and making noises.

- From this an initial version of the **data visualisation was mapped out**, along with the data that would be required from the **flask app**.

	_id	count
0	Adult	2568
1	Juvenile	330
2	Not_noted	125

	_id	count
0	Ground Plane	2116
1	Above Ground	843
2	Not_noted	64

	_id	count
0	PM	1676
1	AM	1347

# Flask APP

Four routes were required for the data visualisation:

1. **coordinates** - Latitude and Longitude data for each squirrel, along with squirrel colour and time of sighting
2. **about** - Covering fur colour, age and where the squirrel was (on or above ground)
3. **activity** - Data on movement, eating, and noises.
4. **time** – The time (AM or PM) the squirrel was observed

## Welcome to this api for the NYC 2018 Squirrel Census

### Available routes are:

```
/api/v1.0/coordinates  
/api/v1.0/about  
/api/v1.0/activity  
/api/v1.0/time
```

```

# Visualisation

The visualisation was completed using JavaScript, html, and css.

Multiple JS libraries were used:

- Leaflet for the heatmap
- Apex charts for the radial bar charts
- Plotly for the bar charts

Users can interact with the charts via multiple ways:

- Select different layers on the heatmap
- Click on and off bars on the radial bar charts
- Select a time to display the data on squirrel activity

## Squirrels in Central Park NY

Data from the the 2018 census

Summary statistics of the 3,023 squirrels

Squirrel activity on observation

# Findings

---

# Location

## Gray squirrels

Gray squirrels can be found throughout the park, with a higher concentration in the southern part of the park.

## Cinnamon squirrels

Cinnamon squirrels are largely concentrated in the south west corner of the park

## Black squirrels

Black squirrels are concentrated in the North Meadow, near the Recreation Center.

<b>Colour</b>	<ul style="list-style-type: none"> <li>- <b>Gray squirrels</b> are the <b>most prevalent</b>, making up 82% of all squirrels in the park.</li> <li>- Cinnamon coloured squirrels are less common, making up 13%.</li> <li>- Followed by the mysterious black squirrel who make up only 3% of all squirrels in the park</li> </ul>
<b>Age</b>	<ul style="list-style-type: none"> <li>- <b>Adult squirrels</b> make up the majority of those in the park at <b>85%</b></li> <li>- While juvenile squirrels consist of 11% total squirrels.</li> </ul>
<b>Ground level or above</b>	<ul style="list-style-type: none"> <li>- <b>Squirrels</b> were <b>largely observed above ground</b> (at 70%).</li> <li>- While just under a third were sighted at ground level.</li> </ul>
<b>Behaviour</b>	<ul style="list-style-type: none"> <li>- The <b>most common</b> behaviour observed was <b>foraging and or eating</b>. <ul style="list-style-type: none"> <li>- Foraging and eating was slightly higher amongst squirrels observed in the afternoon.</li> </ul> </li> <li>- <b>Movement</b> (notably climbing and running) was the next most common behaviour. <ul style="list-style-type: none"> <li>- Movement was slightly higher amongst squirrels observed in the morning.</li> </ul> </li> <li>- Only a small portion of squirrels were heard to be making a <b>noise</b> when found. <ul style="list-style-type: none"> <li>- No difference between squirrels observed in the morning or afternoon.</li> </ul> </li> </ul>
